LAPLACE TRANSFORM AND ITS APPLICATIONS

Manchala Sabitha
Dept of Mathematics, DIET, Hyderabad (India)

ABSTRACT
An introduction to Laplace Transform is the topic of this paper. It deals with what Laplace Transform is, and what is it actually used for. The definition of Laplace Transform and most of its important properties have been mentioned with detailed proofs. This paper also includes a brief overview of Inverse Laplace Transform. A number a methods used to find the time domain function from its frequency domain equivalent have been explained with detailed explanations. It also includes the formulation of Laplace Transform of certain special function like the Heaviside’s Unit Step Function and the Dirac Delta Function. A few practical life applications of Laplace Transform have also been stated.

Keywords: Laplace Transform, Heaviside’s, properties, Dirac Delta.

I. INTRODUCTION
This paper deals with a brief overview of what Laplace Transform is and its application in the industry. The Laplace Transform is a specific type of integral transform. Considering a function f(t), its corresponding Laplace Transform will be denoted as L[f(t)], where L is the operator operated on the time domain function f(t).

The Laplace Transform of a function results in a new function of complex frequency s. Like the Fourier Transform, the Laplace Transform is also used in solving differential and integral equations. It is also predominantly used in the analysis of transient events in the electrical circuits where frequency domain analysis is used.

Important analytical method for solving linear ordinary differential

II. DEFINITION OF LAPLACE TRANSFORM
Consider a function of time f(t). If this function satisfies certain conditions and if the integral, \( \int_{0}^{\infty} e^{-st} f(t) dt \) exists, then \( \int_{0}^{\infty} e^{-st} f(t) dt \) represents the Laplace Transform of f(t), i.e.

\[ L[f(t)] = \int_{0}^{\infty} e^{-st} f(t) dt \quad \text{... (1)} \]

III. PROPERTIES AND THEOREMS OF LAPLACE TRANSFORM

3.1 Linearity Property: If \( k_1 \) and \( k_2 \) are constants, then, \( L[k_1 f_1(t) + k_2 f_2(t)] = k_1 L[f_1(t)] + k_2 L[f_2(t)] \) \text{... (2)}

3.2 Change of Scale Property:
A linear multiplication or division of a constant with the variable is known as scaling. Thus, if \( L[f(t)] = \Phi(s) \) then by change of scale property, \( L[f(at)] = \frac{1}{a} \Phi \left( \frac{s}{a} \right) \quad \text{... ... (3)} \)

3.3 First Shifting Theorem
The First Shifting Theorem of Laplace Transform states
that if \( L[f(t)] = \Phi(s) \) then \( L[e^{-at} f(t)] = \Phi(s + a) \) \text{... ... (4)}

...
The Second Shifting Theorem of Laplace Transform states that if \( L[f(t)] = \emptyset(s) \), then the Laplace Transform of the following function, \( g(t) = f(t-a) \) when \( t > a \) and \( g(t) = 0 \) when \( t < a \). Is expressed as \( L[g(t)] = e^{-as} \emptyset(s) \). .............(5)

3.5 Multiplication of powers of the variable

The variable that has been used so far is ‘t’. Thus, if we multiply powers of \( t \) with the original function \( f(t) \), the Laplace transform can be expressed as \( L[t^n f(t)] = (-1)^n \frac{d^n}{ds^n} \emptyset(s) \). ........(6)

3.6 Division of variable

If \( L[f(t)] = \emptyset(s) \), then the Laplace Transform when the function is divided by the variable can be expressed as \( L \left[ \frac{f(t)}{t} \right] = \int_0^\infty \emptyset(s) \). .... (7)

IV. LAPLACE TRANSFORM OF DERIVATIVES

Let \( f(t) \) be the time domain function. The Laplace Transform of its derivative can be expressed as \( L[f'(t)] = sL[f(t)] - f(0) \) .......(8)

V. LAPLACE TRANSFORM OF INTEGRALS

When the time domain function is integrated, its Laplace Transform can be expressed as \( L[\int_0^t f(u)du] = 1/s\emptyset(s) \). .......(9)

VI. INVERSE LAPLACE TRANSFORM

6.1 Definition

If \( L[f(t)] = \emptyset(s) = \int_0^\infty e^{-st} f(t) dt \), then \( f(t) \) is called the Inverse Laplace Transform of \( \emptyset(s) \).

It can be denoted as \( L^{-1}[\emptyset(s)] = f(t) \) .......(10)

Thus, the frequency domain function \( \emptyset(s) \) can be converted to its corresponding time domain equivalent \( f \) converted to its corresponding time domain equivalent \( f(t) \) using the Laplace Inverse operator \( (L^{-1}) \).

VI. DIFFERENT METHODS OF OBTAINING INVERSE LAPLACE TRANSFORM

There are numerous ways to obtain the Inverse Laplace Transform of a given frequency domain function. The choice of the method employed in solving a problem depends on the nature and structure of the problem itself. Often it would be noted that a single problem can be solved by multiple methods. A few methods have been explained below.

7.1 Using Standard Results

A few standard results which can be used to find the inverse Laplace Transform have been tabulated below. These results can be easily proven using the standard definitions as mentioned in equations (1) and (10).
Table 1

<table>
<thead>
<tr>
<th>Frequency domain function</th>
<th>Inverse Laplace transform</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\frac{1}{s}$</td>
<td>$L^{-1}\left(\frac{1}{s}\right) = 1$</td>
</tr>
<tr>
<td>$\frac{1}{s+a}$</td>
<td>$L^{-1}\left[\frac{1}{s+a}\right] = e^{-at}$</td>
</tr>
<tr>
<td>$\frac{1}{s^n}$</td>
<td>$L^{-1}\left[\frac{1}{s^n}\right] = \frac{t^{n-1}}{n!}$</td>
</tr>
<tr>
<td>$\frac{1}{s^2+a^2}$</td>
<td>$\frac{1}{a}L^{-1}\left[\frac{1}{s^2+a^2}\right]$</td>
</tr>
<tr>
<td>$\frac{s}{s^2+a^2}$</td>
<td>$L^{-1}\left[\frac{s}{s^2+a^2}\right]$</td>
</tr>
</tbody>
</table>

7.2 Using First Shifting Theorem

First Shifting Theorem can be expressed as, $L[e^{-at}f(t)] = \Phi(s+a)$ this means that if $f(t) = L^{-1}\left[\Phi(s)\right]$ then $L^{-1}[\Phi(s+a)] = e^{-at}f(t) = e^{-at}L^{-1}\left[\Phi(s)\right] .........(11)$

7.3 Use of Partial Fractions

Whenever possible, it is always easier to solve a problem on Inverse Laplace Transform by expressing the given function $\Phi(s)$ into a sum of linear or quadratic partial fraction as,

$$\Phi(s) = \frac{A}{(s+a)^2} + \frac{Bs+C}{(s^2+a^2)^{\alpha}}$$

and then use standard results given in table 1 to find corresponding Inverse Laplace Transform.

7.4 Using Change of Scale Property

From equation 3, the change of scale property can be expressed as, $L[tf(at)] = \frac{1}{a}\Phi\left(\frac{t}{a}\right)$

Thus if $f(t) = L^{-1}\left[\Phi(s)\right]$, then $L^{-1}\left[\frac{1}{a}\Phi\left(\frac{t}{a}\right)\right] = tf(at)$ .......(12)

7.5 Convolution Theorem

7.5.1 Definition

If $f_1(t)$ and $f_2(t)$ are two functions, then the following integral $\int_0^t f_1(u)f_2(t-u)du$ is called the convolution of $f_1(t)$ and $f_2(t)$ and is denoted as $f_1(t) * f_2(t)$

$$\int_0^t f_1(u)f_2(t-u)du .......(13)$$

7.5.2 Theorem

Let $L[f_1(t)] = \Phi_1(s)$ and $L[f_2(t)] = \Phi_2(s)$ then $L^{-1}\left[\Phi_1(s)\Phi_2(s)\right] = \int_0^t f_1(u)f_2(t-u)du .......(14)$

Where $f(t) = L^{-1}\left[\Phi_1(s)\right]$ and $f_2(t) = L^{-1}\left[\Phi_2(s)\right]$
7.6 Using Differentiation of $\emptyset (s)$

If $L[f(s)] = \emptyset (s)$, then using $n=1$ in equation 6, $L[f(t)] = -\emptyset (s)$

$\therefore L[t \ f(t)] = -L^{-1}[\emptyset (s)]$  

$\therefore L^{-1}[t \ f(t)] = -\frac{1}{s}L^{-1}[\emptyset (s)]$  

This method is particularly used to find the Inverse Laplace Transform of functions having $\tan^{-1} x, \cot^{-1} x$ and $\log x$ terms.

7.7 Using Integration of $f(t)$

Equation (9) gives us the result of the Laplace Transform when the function $f(t)$ is integrated as shown, $L[\int_0^t f(u)du] = \frac{1}{s} \emptyset (s)$

$\therefore L[\int_0^t f(u)du] = L^{-1} \left[ \frac{1}{s} \emptyset (s) \right]$ 

But by definition, $f(t) = L^{-1} [\emptyset (s)]$

$\therefore L^{-1} \left[ \frac{1}{s} \emptyset (s) \right] = \int_0^t L^{-1} [\emptyset (s)] \, ds$  

(VII. LAPLACE TRANSFORM OF PERIODIC FUNCTIONS)

Considering $f(t)$ to be a periodic function with period $a$, its Laplace Transform can be expressed as $L[f(t)] = \frac{1}{1-e^{-as}} \int_0^a e^{-st} f(t) \, dt$  

... (17)

IX. HEAVISIDE’S UNIT STEP FUNCTION

Heaviside’s Unit Step Function can have only two possible values either 0 or 1. It can be defined as, $H(t) = \begin{cases} 0, & t < 0 \\ 1, & t \geq 0 \end{cases}$ The function takes a jump of unit magnitude at $x=0$.

Taking the Laplace transform of the above function

$L[H(t)] = \int_0^\infty e^{-st} H(t) \, dt$  

$\therefore L[H(t)] = \int_0^\infty e^{-st} \, dt$  

$= \frac{1}{s}$  

... (18)

X. IMPULSE FUNCTION (OR DIRAC DELTA FUNCTION)

The impulse function is obtained by taking the limit of the rectangular pulse as its width, $t_w$, goes to zero but holding the area under the pulse constant at one.

Solution of ODEs by Laplace Transforms Procedure:

- Take the $L$ of both sides of the ODE.
- Rearrange the resulting algebraic equation in the $s$ domain to solve for the $L$ of the output variable, e.g., $Y(s)$.
- Perform a partial fraction expansion.
- Use the $L^{-1}$ to find $y(t)$ from the expression for $Y(s)$. 
XI. APPLICATIONS
Laplace Transforms are put to incredible amount of use in solving differential equations and in circuit analysis which involves the components like resistors, inductors and capacitors. Most often, during circuit analysis, the time domain equations are first written and then Laplace Transform of the time domain equation is taken to convert it to its frequency domain equivalent. However, it is also possible to convert the circuit impedance into its frequency domain equivalent and then proceed, both of which produce the same result.

XII. CONCLUSION
This paper thus, consisted of a brief overview of what Laplace Transform is, and what is it used for. The primary use of Laplace Transform of converting a time domain function into its frequency domain equivalent was also discussed. Major properties of Laplace Transform and a few special functions like the Heaviside’s Unit Step Function and Dirac Delta Functions were also discussed in detail. It also included a detailed explanation of Inverse Laplace Transform and the various methods that can be employed in finding the Inverse Laplace Transform. It goes without saying that Laplace Transform is put to tremendous use in many branches of Applied Sciences.
