

## On $w-\alpha-\mathfrak{I}$ sets and $w-\alpha-\mathfrak{I}$ functions

Nitakshi Goyal

*Department of Mathematics, Punjabi University Patiala, Punjab(India)*

### ABSTRACT

In this paper we will give various properties of  $w-\alpha-\mathfrak{I}$ -open and  $w-\alpha-\mathfrak{I}$ -closed sets. Also  $w-\alpha-\mathfrak{I}$ -open and  $w-\alpha-\mathfrak{I}$ -closed mappings are discussed.

**Key Words and phrases:**  $w-\alpha-\mathfrak{I}$ -open,  $w$ -semi- $\mathfrak{I}$ -open,  $w$ -pre- $\mathfrak{I}$ -open.

2000 MSC: 54C10, 54A05, 54D25, 54D30.

### I. INTRODUCTION

In [2], Dontchev introduced the concept of pre- $\mathfrak{I}$ -open sets and in [3] Hatir and Noiri introduced the notion of semi- $\mathfrak{I}$ -open sets,  $\alpha$ - $\mathfrak{I}$ -open sets and  $\beta$ - $\mathfrak{I}$ -open sets. Further in [1], A.Acikgoz et al. Obtain several characterizations of  $\alpha$ - $\mathfrak{I}$ -continuous functions and introduced the concept of  $\alpha$ - $\mathfrak{I}$ -open functions in ideal topological spaces and obtain their properties. The subject of ideals in topological spaces were introduced by Kuratowski[4] and further studied by Vaidyanathaswamy[5]. Corresponding to an ideal a new topology  $\tau^*(\mathfrak{I}, \tau)$  called the  $*$ -topology was given which is generally finer than the original topology having the kuratowski closure operator  $cl^*(A) = A \cup A^*(\mathfrak{I}, \tau)$ [6], where  $A^*(\mathfrak{I}, \tau) = \{x \in X : U \cap A \notin \mathfrak{I} \text{ for every open subset } U \text{ of } x \text{ in } X\}$  called a local function of  $A$  with respect to  $\mathfrak{I}$  and  $\tau$ . We will write  $\tau^*$  for  $\tau^*(\mathfrak{I}, \tau)$ .

The following section contains some definitions and results that will be used in our further sections.

**Definition 1.1.[4]:** Let  $(X, \tau)$  be a topological space. An ideal  $\mathfrak{I}$  on  $X$  is a collection of non-empty subsets of  $X$  such that (a)  $\phi \in \mathfrak{I}$  (b)  $A \in \mathfrak{I}$  and  $B \in \mathfrak{I}$  implies  $A \cup B \in \mathfrak{I}$  (c)  $B \in \mathfrak{I}$  and  $A \subset B$  implies  $A \in \mathfrak{I}$ .

**Definition 1.2 :** Let  $(X, \tau, \mathfrak{I})$  be an ideal space and  $A$  be any subset of  $X$ . Then  $A$  is said to be

- semi- $\mathfrak{I}$ -open[3] if  $A \subset cl^*(int(A))$ .
- pre- $\mathfrak{I}$ -open[2] if  $A \subset int(cl^*(A))$ .
- $\alpha$ - $\mathfrak{I}$ -open[3] if  $A \subset int(cl^*(int(A)))$ .
- $\beta$ - $\mathfrak{I}$ -open[3] if  $A \subset cl(int(cl^*(A)))$ .

### II. RESULTS

**Definition 2.1:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space and  $A$  be any subset of  $X$ . Then  $A$  is said to be

- $w-\alpha-\mathfrak{I}$ -open if  $A \subset int(cl(int^*(A)))$ .

- b.)  $w$ -semi- $\mathfrak{I}$ -open if  $A \subset \text{cl}(\text{int}^*(A))$ .
- c.)  $w$ -pre- $\mathfrak{I}$ -open if  $A \subset \text{int}^*(\text{cl}(A))$ .

**Definition 2.2:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space and  $A$  be any subset of  $X$ . Then  $A$  is said to be

- a.)  $\alpha^*$ - $\mathfrak{I}$ -open if  $A \subset \text{int}^*(\text{cl}^*(\text{int}^*(A)))$ .
- b.) semi- $\mathfrak{I}$ -open if  $A \subset \text{cl}^*(\text{int}^*(A))$ .
- c.) Pre- $\mathfrak{I}$ -open if  $A \subset \text{int}^*(\text{cl}^*(A))$ .

**Lemma 2.3:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space and  $U$  and  $V$  be two  $\tau^*$ -open subsets of  $X$ . Then prove that

$$\text{cl}^*(U) \cap V \subset \text{cl}^*(U \cap V).$$

**Proof:** Let  $x \in \text{cl}^*(U) \cap V$ . To prove  $x \in \text{cl}^*(U \cap V)$ . Let  $W$  be any  $\tau^*$ -open set containing  $x$ . Then  $x \in V$  and  $V$  is  $\tau^*$ -open set implies that  $V \cap W$  is also  $\tau^*$ -open set containing  $x$ . Now  $x \in \text{cl}^*(U)$  implies that  $V \cap W \cap U \neq \emptyset$  and so  $W \cap (U \cap V) \neq \emptyset$  implies that  $x \in \text{cl}^*(U \cap V)$ .

Hence  $\text{cl}^*(U) \cap V \subset \text{cl}^*(U \cap V)$ .

**Theorem 2.4:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space and  $A$  be any subset of  $X$ . Then prove that  $A$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open if and only if  $A$  is  $w$ -pre- $\mathfrak{I}$ -open and  $A$  is  $w$ -semi- $\mathfrak{I}$ -open subset of  $X$ .

**Proof:** Firstly, let  $A$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$  then  $A \subset \text{int}(\text{cl}(\text{int}^*(A)))$  and so  $A \subset \text{cl}(\text{int}^*(A))$ . Also  $A \subset \text{int}^*(\text{cl}(A))$ . This implies that  $A$  is  $w$ -pre- $\mathfrak{I}$ -open and  $w$ -semi- $\mathfrak{I}$ -open subset of  $X$ .

Conversely, let  $A$  is  $w$ -pre- $\mathfrak{I}$ -open and  $w$ -semi- $\mathfrak{I}$ -open subset of  $X$ . Then  $A$  is  $w$ -pre- $\mathfrak{I}$ -open implies that  $A \subset \text{int}^*(\text{cl}(A))$  and further  $A$  is  $w$ -semi- $\mathfrak{I}$ -open implies that  $A \subset \text{int}^*(\text{cl}(\text{cl}(\text{int}^*(A)))) = \text{int}^*(\text{cl}(\text{int}^*(A)))$ .

Hence  $A$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$ .

**Proposition 2.5 :** Let  $(X, \tau, \mathfrak{I})$  be an ideal space.

- (a) If  $V$  is semi- $\mathfrak{I}$ -open and  $A$  is  $\alpha^*$ - $\mathfrak{I}$ -open subset of  $X$  then  $V \cap A$  is semi- $\mathfrak{I}$ -open subset of  $X$ .
- (b) If  $V$  is pre- $\mathfrak{I}$ -open and  $A$  is  $\alpha^*$ - $\mathfrak{I}$ -open subset of  $X$  then  $V \cap A$  is pre- $\mathfrak{I}$ -open subset of  $X$ .

**Proof:** (a): Let  $V$  is semi- $\mathfrak{I}$ -open and  $A$  is  $\alpha^*$ - $\mathfrak{I}$ -open subset of  $X$ .

$$\text{Then } V \cap A \subset \text{cl}^*(\text{int}^*(V)) \cap \text{int}^*(\text{cl}^*(\text{int}^*(A)))$$

$$\subset \text{cl}^*(\text{int}^*(V) \cap \text{int}^*(\text{cl}^*(\text{int}^*(A)))) \text{ using Lemma 2.3.}$$

$$\subset \text{cl}^*(\text{int}^*(V) \cap \text{cl}^*(\text{int}^*(A)))$$

$$\begin{aligned} &\subset \text{cl}^*(\text{cl}^*(\text{int}^*(V) \cap \text{int}^*(A))) \\ &= \text{cl}^*(\text{int}^*(V) \cap \text{int}^*(A)) \\ &\subset \text{cl}(\text{int}^*(V \cap A)). \end{aligned}$$

Hence  $V \cap A$  is semi\*- $\mathfrak{I}$ -open subset of  $X$ .

(b): Let  $V$  be pre\*- $\mathfrak{I}$ -open and  $A$  be  $\alpha^*$ - $\mathfrak{I}$ -open subset of  $X$ .

Then  $V \cap A \subset \text{int}^*(\text{cl}^*(V)) \cap \text{int}^*(\text{cl}^*(\text{int}^*(A)))$

$$\begin{aligned} &= \text{int}^*(\text{int}^*(\text{cl}(V)) \cap \text{cl}(\text{int}^*(A))) \\ &\subset \text{int}^*(\text{cl}(\text{int}^*(\text{cl}^*(V)) \cap \text{int}^*(A))) \\ &\subset \text{int}^*(\text{cl}(\text{cl}(V) \cap \text{int}^*(A))) \\ &\subset \text{int}^*(\text{cl}^*(\text{cl}^*(V \cap \text{int}^*(A)))) \\ &= \text{int}^*(\text{cl}^*(V \cap \text{int}^*(A))) \\ &\subset \text{int}^*(\text{cl}^*(V \cap A)). \end{aligned}$$

Hence  $V \cap A$  is pre\*- $\mathfrak{I}$ -open subset of  $X$ .

**Corollary 2.6:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space.

- (a) If  $V$  is semi\*- $\mathfrak{I}$ -open and  $A$  is  $\tau^*$ -open subset of  $X$  then  $V \cap A$  is semi\*- $\mathfrak{I}$ -open.
- (b) If  $V$  is pre\*- $\mathfrak{I}$ -open and  $A$  is  $\tau^*$ -open subset of  $X$  then  $V \cap A$  is semi\*- $\mathfrak{I}$ -open.

**Proof:** Proof follows from the above Theorem and the fact that every  $\tau^*$ -open subset of  $X$  is  $\alpha^*$ - $\mathfrak{I}$ -open subset of  $X$ .

**Theorem 2.7:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space. Then a subset  $B$  of  $X$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open iff there exist  $\tau^*$ -open subset  $U$  of  $X$  such that  $U \subset B \subset \text{int}^*(\text{cl}(U))$ .

**Proof:** Firstly, let  $B$  be  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$ . Then  $B \subset \text{int}^*(\text{cl}(\text{int}^*(B)))$ . Let  $U = \text{int}^*(B)$ . Since we know that  $\text{int}^*(B)$  is  $\tau^*$ -open so  $U$  is  $\tau^*$ -open subset of  $X$  such that  $U \subset B \subset \text{int}^*(\text{cl}(U))$ .

Conversely, let there exist  $\tau^*$ -open subset  $U$  of  $X$  such that  $U \subset B \subset \text{int}^*(\text{cl}(U))$ . Now  $U \subset B$  implies that  $\text{int}^*(U) \subset \text{int}^*(B)$  and so  $U \subset \text{int}^*(B)$ . Therefore,  $B \subset \text{int}^*(\text{cl}(U))$  implies that  $B \subset \text{int}^*(\text{cl}(\text{int}^*(B)))$ .

Hence  $B$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$ .

**Theorem 2.8:** If  $A$  is  $w$ -semi- $\mathfrak{I}$ -open subset of an ideal space  $(X, \tau, \mathfrak{I})$  and be any subset of  $X$  such that

$A \subset B \subset \text{int}^*(\text{cl}(A))$  then prove that  $B$  is also  $w$ - $\alpha$ - $\mathfrak{I}$ -open.

**Proof:** Let  $A$  be any  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$  and  $B$  be any subset of  $X$  such that  $A \subset B \subset \text{int}^*(\text{cl}(A))$ . Now  $A$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$  so by the above Theorem 2.7 there exist  $\tau$ -open subset  $G$  of  $X$  such that  $G \subset A \subset \text{int}^*(\text{cl}(G))$  and so  $G \subset A \subset B \subset \text{int}^*(\text{cl}(A)) \subset \text{int}^*(\text{cl}(\text{int}^*(\text{cl}(G)))) \subset \text{int}^*(\text{cl}(\text{cl}(G)))$

$$= \text{int}^*(\text{cl}(G)).$$

Therefore,  $G \subset B \subset \text{int}^*(\text{cl}(G))$ .

Hence  $B$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open.

**Theorem 2.9:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space. Then prove the following:

- (a) If  $\{U_\alpha\}_{\alpha \in \Delta}$  be a family of  $w$ - $\alpha$ - $\mathfrak{I}$ -open subsets of  $X$ . Then prove that  $\bigcup_\alpha U_\alpha$  is also a  $w$ - $\alpha$ - $\mathfrak{I}$ -open set.
- (b) If  $U$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$  and  $V$  is  $\tau$ -open subset of  $X$  then prove that  $U \cap V$  is also a  $w$ - $\alpha$ - $\mathfrak{I}$ -open set.

**Proof:** (a) Since  $\forall \alpha \in \Delta$ ,  $U_\alpha$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$ . So  $U_\alpha \subset \text{int}^*(\text{cl}(\text{int}^*(U_\alpha)))$ .

Now  $\bigcup_\alpha U_\alpha \subset \bigcup_\alpha \text{int}^*(\text{cl}(\text{int}^*(U_\alpha)))$  and so  $\bigcup_\alpha U_\alpha \subset \text{int}^*(\bigcup_\alpha \text{cl}(\text{int}^*(U_\alpha)))$  since

$\bigcup_\alpha \text{int}(A_\alpha) \subset \text{int}(\bigcup_\alpha A_\alpha)$ . Further,  $\bigcup_\alpha \text{cl}(A_\alpha) \subset \text{cl}(\bigcup_\alpha A_\alpha)$  implies that

$\bigcup_\alpha U_\alpha \subset \text{int}^*(\text{cl}(\bigcup_\alpha \text{int}^*(U_\alpha)))$  and so

$\bigcup_\alpha U_\alpha \subset \text{int}^*(\text{cl}(\text{int}^*(\bigcup_\alpha (U_\alpha))))$ .

Hence  $\bigcup_\alpha U_\alpha$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$ .

(b) Let  $U$  be  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$  and  $V$  be  $\tau$ -open subset of  $X$ . Then  $U \subset \text{int}^*(\text{cl}(\text{int}^*(U)))$ . Now

$U \cap V \subset \text{int}^*(\text{cl}(\text{int}^*(U))) \cap V = \text{int}^*(\text{cl}(\text{int}^*(U)) \cap \text{int}(V))$  since  $V$  is  $\tau$ -open subset of  $X$  and so

$U \cap V \subset \text{int}^*(\text{cl}(\text{int}^*(U) \cap \text{int}(V)))$  using Lemma 2.3. But  $\text{int}^*(A) \cap \text{int}^*(B) = \text{int}^*(A \cap B)$ . Therefore,

$U \cap V \subset \text{int}^*(\text{cl}(\text{int}^*(U \cap V)))$ .

Hence  $U \cap V$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open.

Next we introduce  $w$ - $\alpha$ - $\mathfrak{I}$ -closed sets.

**Definition 2.10:** Let  $(X, \tau, \mathfrak{I})$  be an ideal space. Then a subset  $F$  of  $X$  is called  $w$ - $\alpha$ - $\mathfrak{I}$ -closed if its complement  $X-F$  is  $w$ -semi- $\mathfrak{I}$ -open.

**Theorem 2.11:** If a subset  $F$  of an ideal space  $(X, \tau, \mathfrak{I})$  is  $w$ -semi- $\mathfrak{I}$ -closed then prove that  $\text{cl}^*(\text{int}(\text{cl}^*(F))) \subset F$ .

**Proof:** Let  $F$  be any  $w$ - $\alpha$ - $\mathfrak{I}$ -closed subset of  $X$ . Then  $X-F$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $X$ . Therefore,

$X-F \subset \text{int}^*(\text{cl}(\text{int}^*(X-F))) = \text{int}^*(\text{cl}(X-\text{cl}^*(F)))$  using  $\text{int}^*(X-A) = X-\text{cl}^*(A)$  or  $X-\text{int}^*(A) = \text{cl}^*(X-A)$  for any subset  $A$  of  $X$  and so  $X-F \subset \text{int}^*(X-\text{int}(\text{cl}^*(F)))$

$$= X-\text{cl}^*(\text{int}(\text{cl}^*(F)))$$

Therefore,  $\text{cl}^*(\text{int}(\text{cl}^*(F))) \subset F$ .

**Definition 2.12:** Let  $(X, \tau, \mathfrak{I})$  and  $(Y, \sigma, \mathcal{J})$  with  $\mathcal{J} = f(\mathfrak{I})$  be two topological spaces. Then a map  $f : (X, \tau, \mathfrak{I}) \rightarrow (Y, \sigma, \mathcal{J})$  is said to be  $w$ - $\alpha$ - $\mathfrak{I}$ -open(closed) if image of every open(closed) set in  $X$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open(closed) in  $Y$ .

i.e.  $f$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open(closed) if  $\forall G \in \tau$ ,  $f(G)$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open(closed) subset of  $Y$ .

**Theorem 2.13:** Let  $(X, \tau, \mathfrak{I})$  and  $(Y, \sigma, \mathcal{J})$  be two ideal topological spaces and  $f : (X, \tau, \mathfrak{I}) \rightarrow (Y, \sigma, \mathcal{J})$  be any map. Then prove that the following are equivalent:

- $f$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open map.
- For each  $x \in X$  and any open set  $U$  containing  $x$ , there exist  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset  $V$  in  $Y$  containing  $f(x)$  such that  $V \subset f(U)$ .

**Proof:** Firstly, let  $f$  be  $w$ - $\alpha$ - $\mathfrak{I}$ -open map. Let  $x \in X$  be any element and  $U$  be any open set in  $X$  containing  $x$ . This implies that there exist basic open set say  $B$  such that  $x \in B \subset U$ . Now  $f$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open map and  $B$  is open subset of  $X$  implies that  $f(B)$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $Y$  containing  $f(x)$ . Let  $V = f(B)$  then  $B \subset U$  implies that  $f(B) \subset f(U)$ . Hence there exist  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset  $V$  of  $Y$  containing  $f(x)$  such that  $V \subset f(U)$ .

Conversely, let  $G$  be any open subset in  $X$ . We have to prove that  $f(G)$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $Y$ .

Now there can be two possibilities:

Case(i) If  $G = \phi$ , then  $f(G) = \phi$ . Hence we have nothing to prove.

Case(ii) If  $G \neq \phi$ , then  $f(G) \neq \phi$ . Let  $y \in f(G)$  and so there exist  $x \in G$  such that  $y = f(x)$ . Now,  $G$  is the open subset of  $X$  containing  $x$  so there exist  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset  $V$  in  $Y$  containing  $f(x)$  such that  $V \subset f(G)$ .

So,  $\forall y \in f(G)$  there is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset  $V$  in  $Y$  containing  $y$  such that  $y \in V \subset f(G)$ . This implies that  $f(G)$  is union of  $w$ - $\alpha$ - $\mathfrak{I}$ -open subsets of  $Y$ . Hence  $f(G)$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open subset of  $Y$ .

Hence  $f$  is  $w$ - $\alpha$ - $\mathfrak{I}$ -open map.
