### ABSTRACT

Energy is an important and essential one in our day to day life, Energy is available everywhere around us, the only thing is how we are utilising these sources, if we utilize these energy in a useful manner it will helps us to reduce the dependency on the fossil fuel. The world population is growing and increase in numbers of people aspires to higher standards of living: we need more and more energy. We can only do this by producing energy and in a sustainable way, which means creating less waste and lowering CO2 emissions. Energy development is the field of activities focused on obtaining sources of energy from natural resources. These activities include production of conventional, alternative and renewable sources of energy, and for the recovery and reuse of energy that would otherwise be wasted.

It can be used for charging devices e.g. laptop, mobile, etc.

### I. INTRODUCTION

Energy is nothing but the ability to do the work. In day to day life, Electricity is most commonly used energy resource. Now-a-days energy demand is increasing, and which is life-line for people. Due to this number of energy resources are generated and wasted. Electricity can be generated from resources like water, wind etc. to generate the electricity from these resources development of big plants are needed having high maintenance cost. Some other energy resources are also costly and cause pollution. They are not affordable to common people. Electricity has become important resources for human being hence, it is needed that wasted energy must have to utilize, walking is the most common activity done by human being while walking energy is wasted in the form of vibration to the surface. And this wasted energy can be converted into electricity. Using the principle called piezoelectric effect. Piezoelectric effect is the effect in which mechanical vibrations. Pressure or strain applied to piezoelectric material is converted into electrical form. This project gives idea about how energy is used on stepping on stairs. The use of stairs in every building is increasing day by day even small building has some floors when we are stepping amount of this wasted energy is utilized and converted to electricity by Piezoelectric effect. Piezoelectric effect is the effect of specific materials to generate an electric charge in response to applied mechanical stress.

# International Journal of Advance Research in Science and Engineering Volume No.07, Special Issue No. (01), January 2018 www.ijarse.com ILOBJECTIVE

The main objective of the project is to produce electricity in a simple manner. In our day to day life we are walking here and there, the main concept of the project is to utilize these footpaths into an effective energy. And by doing some alteration in the design it can be altered to produce energy from the heat, normally the paver blocks on the road side and open area will be exposed to the sun and it gets heated on the top surface, in this project this solar heat can be utilized for power generation.

Fig., Power Generation in foot path

### **III. POWER GENERATION USING FOOT STEP METHOD**

In this electric power is generated as non-conventional method. Thus the generation of power is by walking or running on foot step. At this time non-conventional energy is very important. This system introduces power generation using non-conventional energy which does not need any input to generate electrical output. In this conversion of force energy into electrical energy takes place.

### A. Working

Key concept of working of this system is capturing unused energy from surrounding any system and converting it into electrical energy. The piezoelectric placed under concrete, tiles and pressure created by foot step and water fall pressure will produce electrical energy which can be stored and used for domestic purpose. The property of Piezoelectric Material is to generate electricity when we apply pressure. It has two axis, mechanical axis & electrical axis. When we apply pressure in mechanical axis, it generates power in its electrical axis. Piezo means the generation of the electrical polarization of a material as a response to mechanical strain. This phenomenon is known as direct effect or generator effect and is applied fundamentally in the manufacture of sensors (mobile phone vibrators, lighters, etc.). In these cases piezoelectric materials, also used in actuators, undergo an inverse or motor effect, i.e. a mechanical deformation due to the application of an electrical signal.

#### **B.** Commercial Utility:

1] We can implement this system in the floor area of stairs, schools and colleges where thousands of students are studying.

# International Journal of Advance Research in Science and Engineering Volume No.07, Special Issue No. (01), January 2018 www.ijarse.com

2] In front of ticket counters and every time a passenger steps on the mats, special flooring tiles were installed, and they trigger a small vibration that can be stored as energy.

### **IV.FOOT STEP POWER GENERATION USING PIEZOELECTRIC TRANSDUCER**

Electricity has become lifeline for human population. Demand of electricity is increasing day by day. Some technology needs high amount of electrical power to perform various operations. As we know electricity is generated by some sources like water, wind etc. To generate the electricity from these resources, development of big plants or big mills is needed having high maintenance cost. As the use of energy is increases, no of energy resources are generated and wasted. If the wastage of energy is rapidly increases then one day will come at that time we will face totally absence of energy.

This technology is based on principle of piezoelectric effect which has ability to build up electrical charge from pressure and strain applied to them. Piezoelectric ceramics belongs to the group of ferroelectric materials. These materials are the crystals and they do not need electric field being applied. Piezoelectric ceramics like PbTio3, PbZro3, PVDF and PZT. Most commonly available piezoelectric materials are PZT and PVDF.

### A.Study of connections-

To give better voltage and current three PZT are connected in series .A force sensor and voltmeter is connected to this series combination. As varying forces are applied on this connection and corresponding voltages are noted. Voltage and current generated across the series connection is measured. The voltage and current generated across the parallel connection is measured. From series connection obtained current is poor and from parallel connection obtained voltage is poor. To overcome this problem rectifier in series-parallel connection is used.

### **B.** Working-

Piezoelectric material converts pressure into electrical energy. The pressure can be either from weight of moving vehicles or from the weight of people walking on it. The produced output is in the variable form .so bridge circuit is used to convert variable voltage into linear voltage. An AC filter is used to filter out this output voltage and it is stored in rechargeable battery. Two possible connections were tested-parallel and series connections for producing 40v output. Inverter is connected to battery and battery connection provide AC load. The voltage produce across the time can be displayed on LCD.

### **V.POWER HARVESTING BY USING HUMAN FOOT STEP**

In this paper use of piezoelectric crystal is to generate electric output from surrounding vibration. Piezoelectric materials have crystalline structure. They can convert mechanical energy into electrical energy and vice versa. The produced electrical energy from piezoelectric crystal is very low in the order of 2-3 volts and is stored in battery to charge controller, since it is not possible to charge 12v battery through crystal output. To increase the voltage, the boost converter circuit is used. The level of voltage ranges 12v and it is stored in 12v battery.

# International Journal of Advance Research in Science and Engineering Volume No.07, Special Issue No. (01), January 2018 www.ijarse.com

### A. Piezoelectric effect-

They also use piezoelectric crystal. The piezoelectric crystal exhibit the piezoelectric effect. This piezoelectric effect having two properties. First one is the direct piezoelectric effect which means that material has ability to convert mechanical strain into electrical charge. Second one is the converse effect, in which the applied electrical potential converted into mechanical strain energy. That means material used as power harvesting medium.

Fig., Function of Piezoelectric Sensor

### **B.** Thermocouple-

Thermocouple is an electrical device consisting of two dissimilar conductors forming electrical junctions at differing temperatures. A thermocouple produces a temperature-dependent voltage as a result of the thermoelectric effect, and this voltage can be interpreted to measure temperature. Thermocouples are a widely used type of sensor. Commercial thermocouples are inexpensive interchangeable, are supplied with standard connectors, and can measure a wide range of temperatures. In contrast to most other methods of temperature measurement, thermocouples are self-powered and require no external form of excitation. The main limitation with thermocouples is accuracy; system errors of less than one degree Celsius (°C) can be difficult to achieve.

### **VI.POWER GENERATION**

Today the major problem which is discussed rapidly energy crisis and ideal solution for this is adaptive renewable energy resources. Among all the energy sources like solar energy tidal energy, human population is also abundant energy resource that has not been yet normally in used. Using this resource expected amount of energy can be generated thus it may be ideal to generate the electricity from human population.

When people walk on the floor then electricity is generated due to weight of person as this system utilizes the parameter pressure to generate energy. This generated energy is stored in the batteries. This system will generate efficient outcome if installed in populated area. Implementation of this project will turn into boon in generation of electricity from the pressure by footsteps.

The places in India where we can implement this system are roads, railway stations, bus stands where millions of people move round the clock. When people walk on the floor their body weight compresses the setup which rotates dynamo and generated energy stored in the battery to reduce external compressions responsive sub-flooring system is installed.

### A. Principle

The principle of the working of this system is conversion of pressure from foot steps into rotary motion and this rotary motion is used to rotate the device like Dynamo or Sanyo coil. The amount of rotation depends upon the pressure by the weight of person walking on the floor.

### **B.**Construction And Working

The system consists of blocks that depress slightly under pressure of human steps and which will depress the mechanical setup placed immediately after it inside the system. This consists of immovable bottom platform and compressible top platform. System also consist of four primary spring a lever assembly, large pulley, small pulley, power generator, shaft with two free wheel bearing and break arrangement.

When people walk on the floor, the floor pressed on the mechanical setup. The setup pressed due to the spring action and pulls the lever assembly which rotates one of the freewheel bearing fitted to the shaft. The shaft then rotates the large pulley which is connected to the smaller pulley through a V-belt. This smaller pulley acts as a reducer this provides more rotations corresponding to one rotation of the large pulley. This smaller pulley coupled with the dynamo (or Sanyo coil), a device that converts the energy of rotary motion into electric current and power is obtained.

This process depends on two factors, primary spring tension and type of generator used. When the pressure is applied through a foot step, ninety-five percent of the pressure applied is converted into energy in this method.

### **VII.PROTOYPE SYSTEM**

### Foot Step Power Generation Using Piezoelectric Material

The piezoelectric material converts the pressure, stress applied to the material into electrical energy. The source of stress is from the weight of the people stepping on the stairs. As the output voltage from a single piezo-film was extremely low, thus combination of few piezoelectric is used. Two types' possible connections can be done parallel connections and series connections. The output of the piezoelectric material is not a regulated one, so variable to linear voltage converter circuit rectifier is used. Ac ripple neutralizer is the circuit used to reduce the ripples from the piezoelectric output. The AC ripple neutralizer consists of rectifier and ripple filter. Again, AC ripples are filtered out using ripple filter and it is used to filter out any further variations in the output and then it can be pass through regulator in order to regulate. The output of the voltage regulator is given to the

unidirectional current controller. Unidirectional current controller means it allows flow of current in only one direction.

Mostly used unidirectional current controller devices are as follows:

1. Diode- we already know that it allows an electrical current in one direction. It acts like a switch. A specific diode converts AC into pulsating DC hence sometimes it also called as rectifier.

2. Thyristor-A thyristor is four-layer semiconductors that are often used for handling large amount of power. While a Thyristor can be turned on or off, it can also regulate power using something called phase angle control. From this system we are generating energy by human footsteps using the piezoelectric effect. Piezoelectric effect is the effect which coverts mechanical stress, stain, pressure into electrical energy. This idea not only overcome the energy crises problem but also helps to maintain the eco-friendly environment for generating energy.

### A. Future Scope:

Utilization of wasted energy is very much relevant and important for highly populated countries in future.

### 1. Flooring Tiles-

Japan has already started experimenting the use of piezoelectric effect for energy generation. They implement piezoelectric effect on the stairs of the bus. Thus every time passenger steps on the tiles; they trigger a small vibration that can be stored as energy.

The flooring tiles are made up of rubber which can absorb the vibration. This vibration generates when running or walking on it. Under these tiles piezoelectric material are placed. When the movement is felt by the material they can generate the electricity. This generated energy is simultaneously stored into the battery. Generated electricity we can use the lightning of lamp or street light. Energy is generated by step of one human being is too less but if number of steps increases ultimately energy production also increases

### 2.Dance floors-

Europe is another one of the country which started experimenting use of piezoelectric crystal for energy generation in night clubs. Floor is compressed by the dancer's feet and piezoelectric materials makes contact and generate electricity. Generated electricity is nothing but 2-20 watt. It depends on impact of the dancer's feet. If constant compression of piezoelectric crystal causes a huge amount of energy.

### VI. CONCLUSION

A piezo tile capable of generating 40V has been devised. Comparison between various piezo electric material shows that PZT is superior in characteristics. Also, by comparison it was found that series- parallel combination connection is more suitable. The weight applied on the tile and corresponding voltage generated is studied and they are found to have linear relation. It is especially suited for implementation in crowded areas. This can be used in street lighting without use of long power lines. It can also be used as charging ports, lighting in buildings.
